

Introduction to Principles

Lecture 3

Tim RMK GIGA

Departemen Teknik Informatika

Address Entry Screen on Tesla's Model

Processor

Predictor

Participant

Processor

Pros

- May use existing data
- Enables objective comparison

Cons

- Doesn't find reason for differences
- Can't differentiate by expertise
- Helps optimize, not redesign

Predictor

Pros

- More complete picture of Interaction
- Target different levels of expertise

Cons

- Analysis may be expensive
- Analysis is subject to biases
- Ignores broader interaction context

Participants

Pros

- Evaluate interaction in context
- Captures authentic user attention

Cons

- Expensive to perform and analyze
- Requires real, functional interfaces
- Subject to uncontrollable variables

Requirement

Fit within human
limits

Fit within user's
knowledge

Fit within usage
context

Evaluation

Quantitative
experiments

Qualitative studies

In situ (real-world)
studies

Pros

Objective comparisons
May use existing data

Fuller picture
May target novices

Authentic context
Faithful user attention

Cons

Expert-Focused
What, not why
Optimize, not redesign

Expensive to analyze
Prone to biases
Ignores context

Expensive to perform
Needs real interfaces
Subject to interface

Good vs Bad Design

User Experiences, Sans Design

Sans Design appears to be a design-related entity, with individuals or entities involved in UI design, interior design, and papeterie/illustration.

Assignment

Summary

1. User interface mediate between users and tasks
2. Usability means efficiency and user satisfaction
3. There are three views of users: processor, predictor, and participants
4. User experience at group and societal levels

Thank You

Tim RMK GIGA
